# Outline

## ➤ Introduction

- MEG II experiment and Radiative Decay Counter
- Upstream RDC and RPC using Diamond-Like Carbon electrodes
- Requirement of radiation hardness for DLC-RPC
- Previous aging tests

## ➤ The aging test of DLC-RPC

- Irradiation facility and test setup
- Status of long-term irradiation
- Aging effects

## ➤ Summary and Prospects

# MEG II experiment and RDC

- MEG II searches for  $\mu^+ \rightarrow e^+ \gamma$  decay
  - Charged lepton flavor violation process  
→ **Clear evidence for new physics**
- Main background is **accidental background**
  - BG- $\gamma$  from radiative muon decay will be tagged by **Radiative Decay Counter**

# Requirements for upstream RDC

➤ Upstream RDC need to detect positrons from RMD in **high-rate** and **low-momentum** muon beam  
( $5.7 \times 10^7 \mu/s$ ) (28 MeV/c)

- 1. Material budget: < 0.1% of radiation length
- 2. Rate capability: 2.3 MHz/cm<sup>2</sup>
- 3. Radiation hardness: > 30 weeks operation
- 4. Detection efficiency: > 90% for MIP e<sup>+</sup>
- 5. Time resolution: < 1 ns
- 6. Detector size: 20 cm diameter

Development of RPC using Diamond-Like Carbon electrodes

## ➤ Features of DLC-RPC

- Low mass by sputtered DLC on polyimide
- Rate capability improved by low DLC resistivity
- Spacers formed by photolithography technology

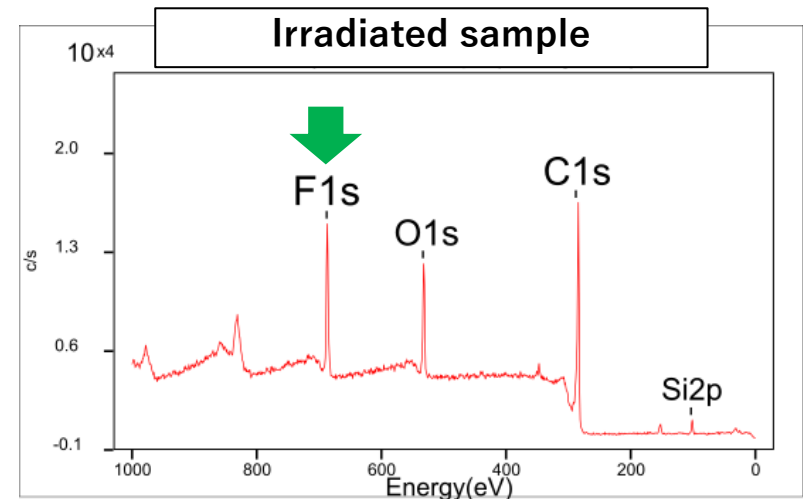

# Requirements of radiation hardness

- Continuous operation during the physics run in the MEG II experiment
  - Physics run period : 30 weeks/year
  - Rate of muon beam at the center: 2.3 MHz/cm<sup>2</sup>
  - Average avalanche charge of muon: 3 pC
- ➔ **~125 C/cm<sup>2</sup> equivalent irradiation dose**
- Carried out the aging tests to evaluate the radiation hardness of DLC-RPC

# DLC-RPC irradiation campaign in 2022

## ➤ Aging tests using fast neutron and X-ray in 2022

- Total irradiation dose
  - For neutron:  $\sim 165 \text{ mC/cm}^2$
  - For X-ray:  $\sim 8.2 \text{ C/cm}^2$
- Results
  - Fluorine deposited on DLC electrodes
  - No change in DLC-RPC performance

Reported on JPS 2022 autumn

# DLC-RPC irradiation campaign in 2023

- The aging test using *X*-ray carried out again in 2023
  - Aging tests 2022 obtained less irradiation than expected
    - ➔ Further irradiation required
- Test period: 2023/8/17 – 9/11

## Today's topics

- The results of DLC-RPC aging test using *X*-ray
  - Reported preliminary results in this talk ([17pR81-1](#))
- Development for ionization chamber for *X*-ray monitoring detector
  - Hiromu will report on next talk ([17pR82-2](#))
  - For more detailed *X*-ray intensity studies

# X-ray irradiation test

## ➤ X-ray generator at KEK Platform-C

- Also using in the aging test in 2022

## ➤ Properties

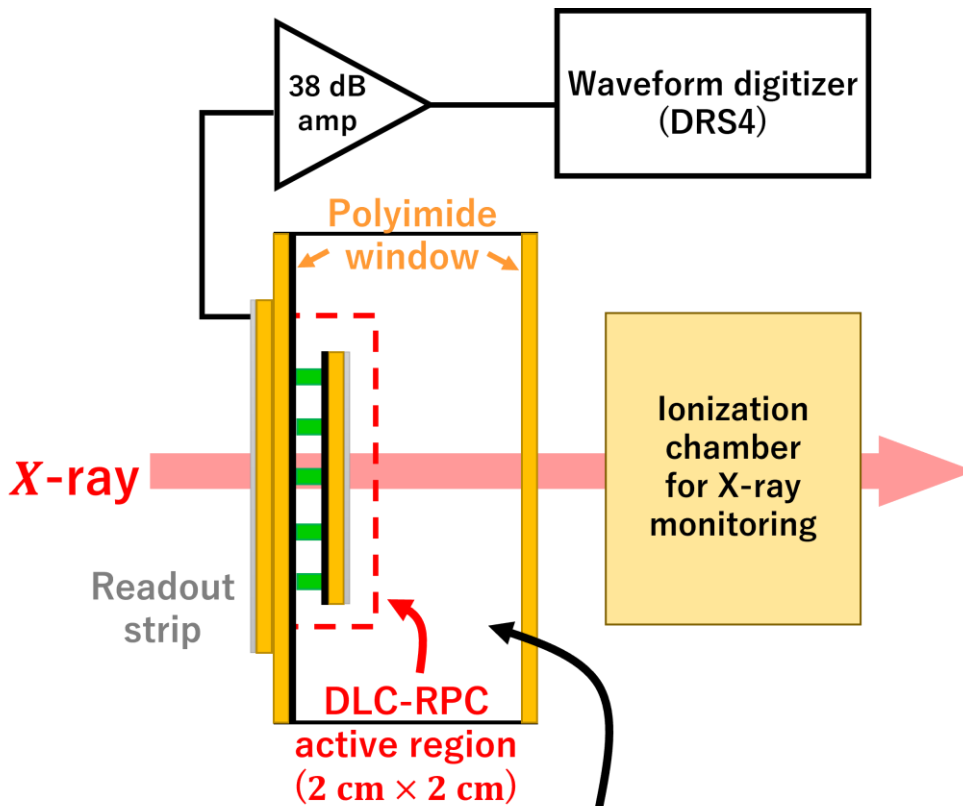

- Target: Cu (X-ray with 8 keV)
  - With monochromator
- Maximum output: 1.8 kW
  - Tube voltage: 60 kV (50 kV in this test)
  - Tube current: 30 mA

# Setup of tests

## Scheme of setup

Gas mixture in the chamber  
Freon (R134a)/iC4H10/SF6 = (94/5/1) %

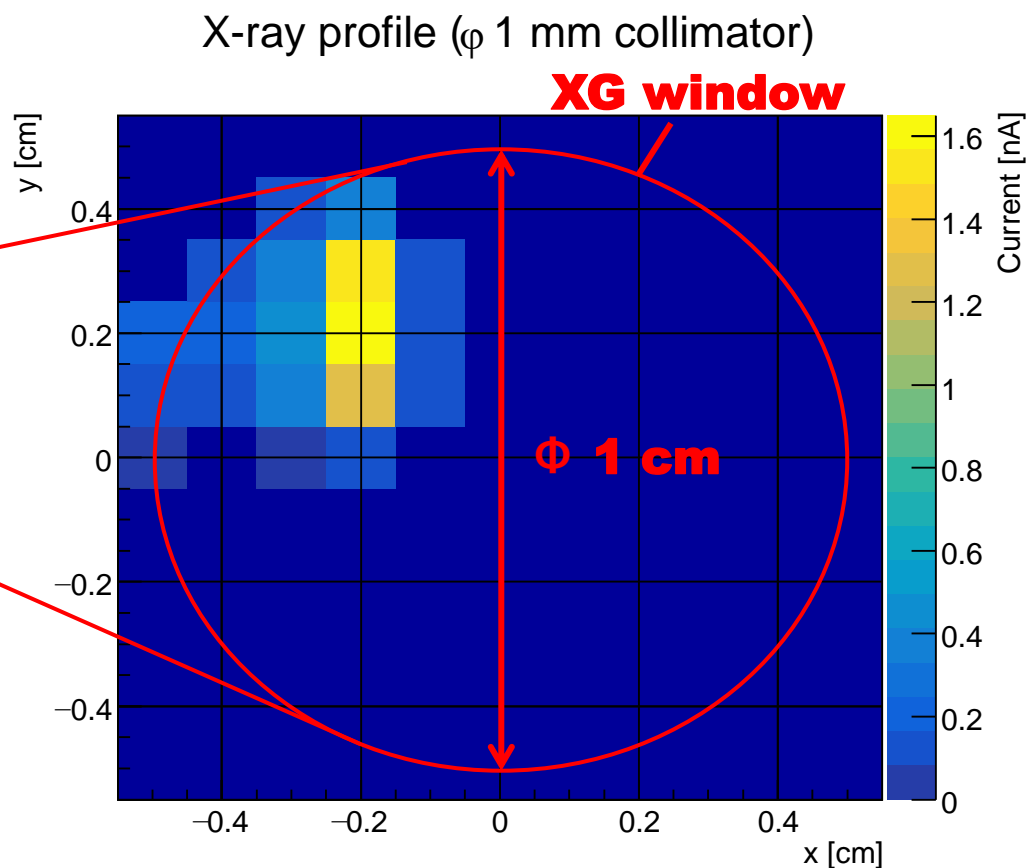

## Front of the chamber

Actually irradiated at close range

# Profile of X-ray beam

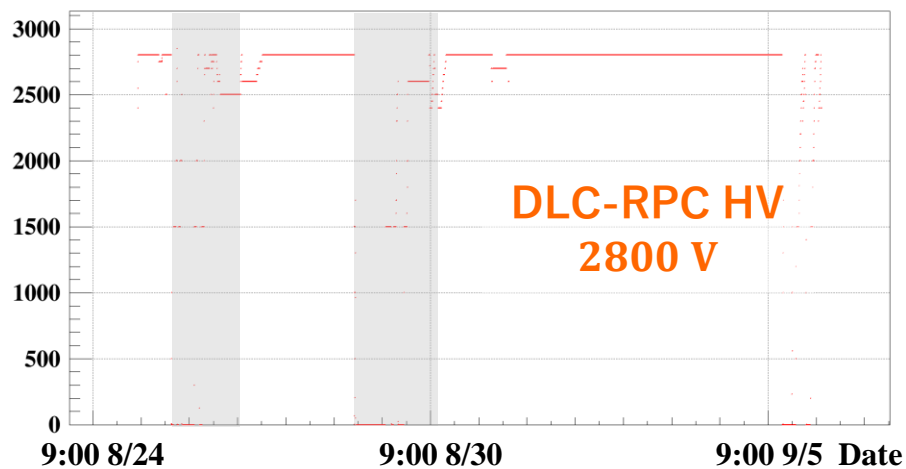

- Measurement by ionization chamber with Pb collimator (see next talk)

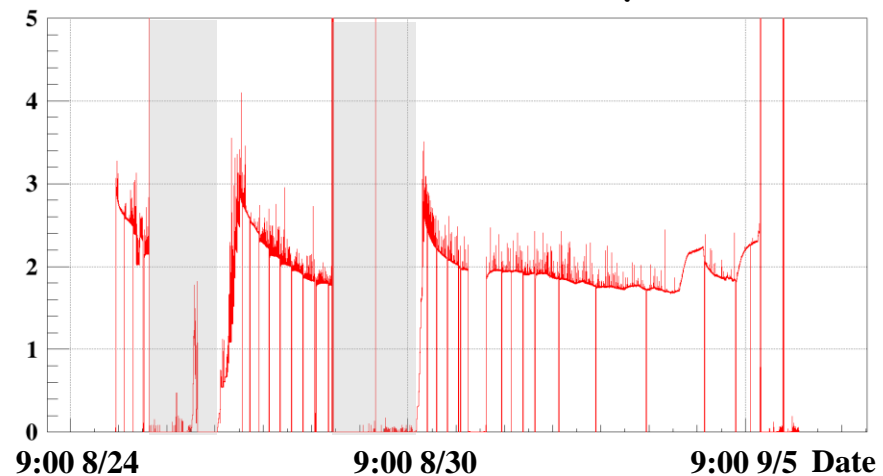

# Status of DLC-RPC during irradiation

- Shaded period: not irradiated due to discharge problems

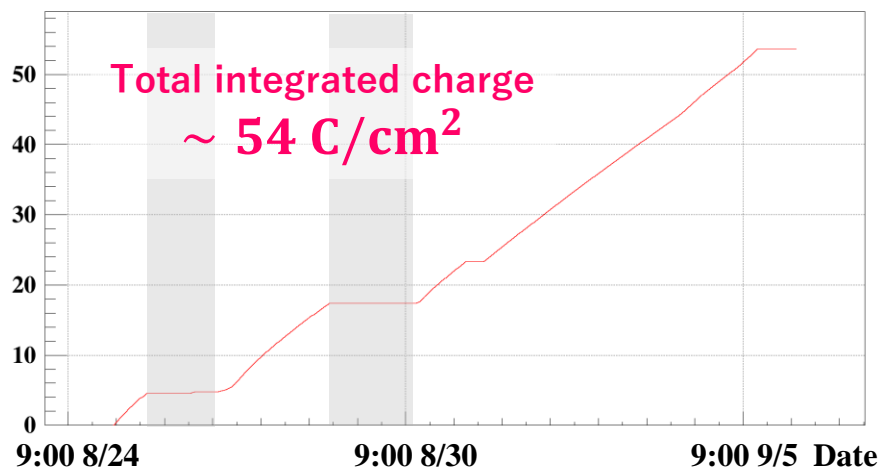

DLC-RPC HV [V]

DLC-RPC HV current [ $\mu\text{A}$ ]

Integrated charge [ $\text{C}/\text{cm}^2$ ]

Ionization chamber HV current [ $\mu\text{A}$ ]

# DLC-RPC current transition

- DLC-RPC HV current decreased during irradiation
  - Different from the ionization chamber HV current change
    - ➔ **Changes in DLC-RPC performance**

DLC-RPC HV current [ $\mu\text{A}$ ]

Ionization chamber HV current [ $\mu\text{A}$ ]

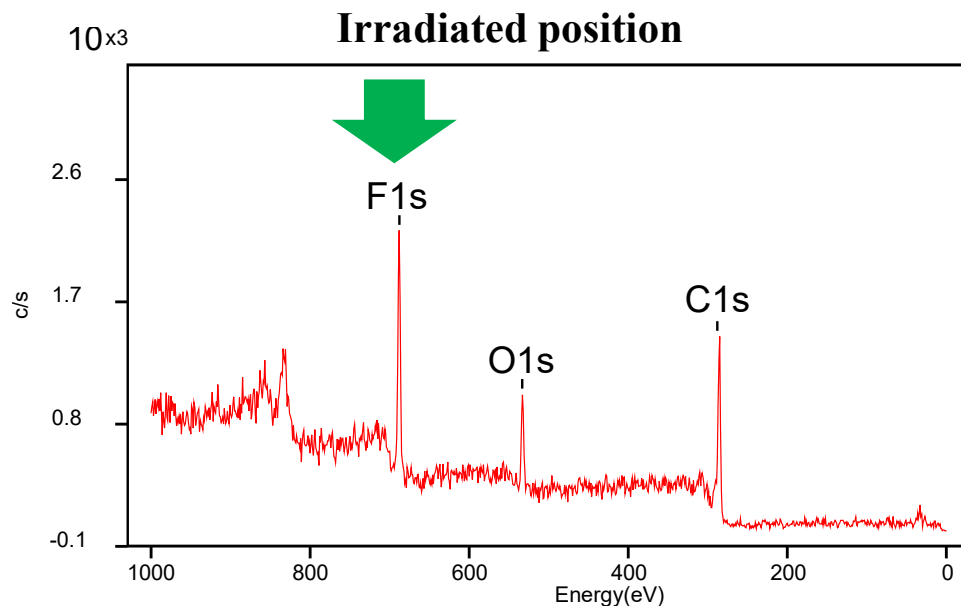

Pulse height distribution for X-ray

- No recovery with gas flow or HV off
- Cleaning electrodes recovers current
  - ➔ **Effects of some deposition**

# Electrodes surface condition

- Fluorine deposition to DLC
  - Using X-ray photoelectron spectroscopy
- Discoloration of DLC due to irradiation
  - **Increased in resistivity of DLC** ( $\sim 60 \text{ M}\Omega/\text{sq.} \rightarrow \sim 100 \text{ M}\Omega/\text{sq.}$ )
  - Affects rate capability of DLC-RPC
  - **Easy peeling of DLC**

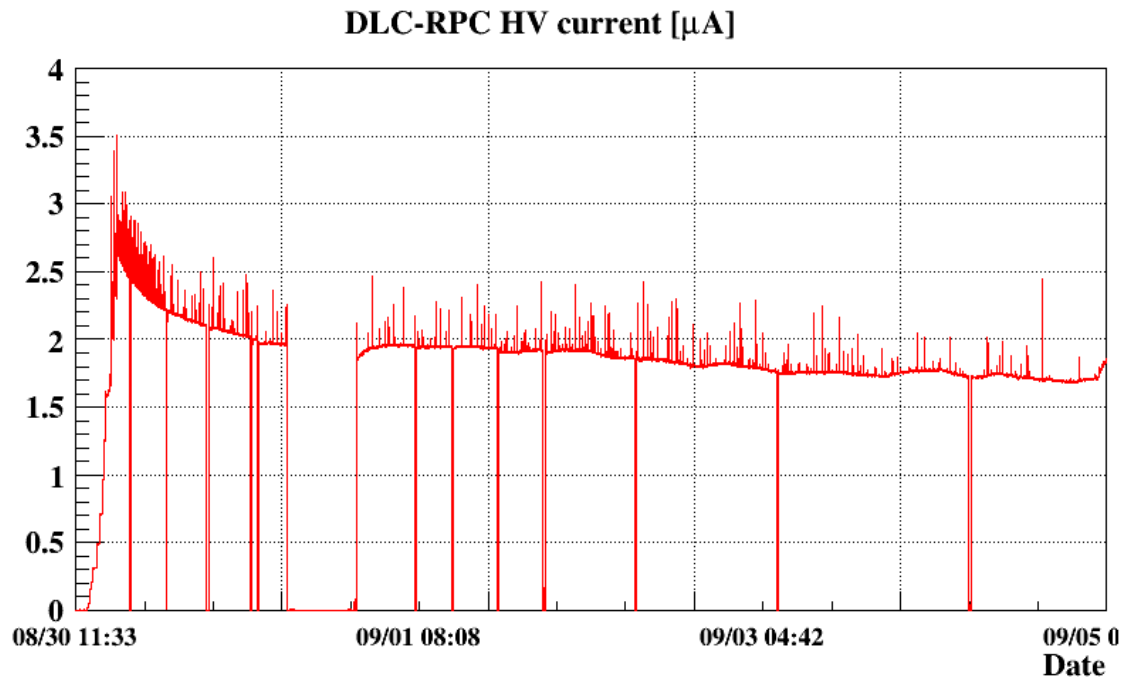

# Summary

- **DLC-RPC is under development for MEG II US-RDC**
  - The low-momentum and high-intensity muon beam passage  
→ Several stringent requirements are imposed
  - Expected irradiation dose is  **$\sim 125 \text{ C/cm}^2$**
- **Additional aging test of DLC-RPC was carried out**
  - Using X-ray generator at KEK Platform-C
  - Total irradiation dose:  **$\sim 54 \text{ C/cm}^2$**
- **Aging effects**
  - **Decrease in DLC-RPC HV current**
  - **Defects of DLC electrodes**

# Prospects

- Investigation of currently observed damage and changes in behavior of DLC-RPC
- **Estimated aging effects in MEG II environment**
  - Irradiation dose in this test:  $\sim 54 \text{ C/cm}^2$
  - Expected in MEG II:  $\sim 125 \text{ C/cm}^2$

# Acknowledgements

- **This work was partially supported by**
  - **The KEK Detector R&D Platform**
  - **Grant-in-Aid for Scientific Research (S)**  
**Grant Number JP21H04991**

**Backup**

# Fluorine deposition

- Fluorine source is operating gas of DLC-RPC
  - DLC-RPC gas: Freon (R134a/C<sub>2</sub>H<sub>2</sub>F<sub>4</sub>) / SF<sub>6</sub> / i-C<sub>4</sub>H<sub>10</sub>
  - SF<sub>6</sub> generates fluorine during avalanche process
    - $\text{SF}_6 + \text{e}^- \rightarrow \text{SF}_6^{-*}, \quad \text{SF}_6^{-*} \rightarrow \text{SF}_5^- + \mathbf{F}$

# Electrode

# Pulse height distribution for X-ray

DLC-RPC HV scan at minimum X-ray intensity

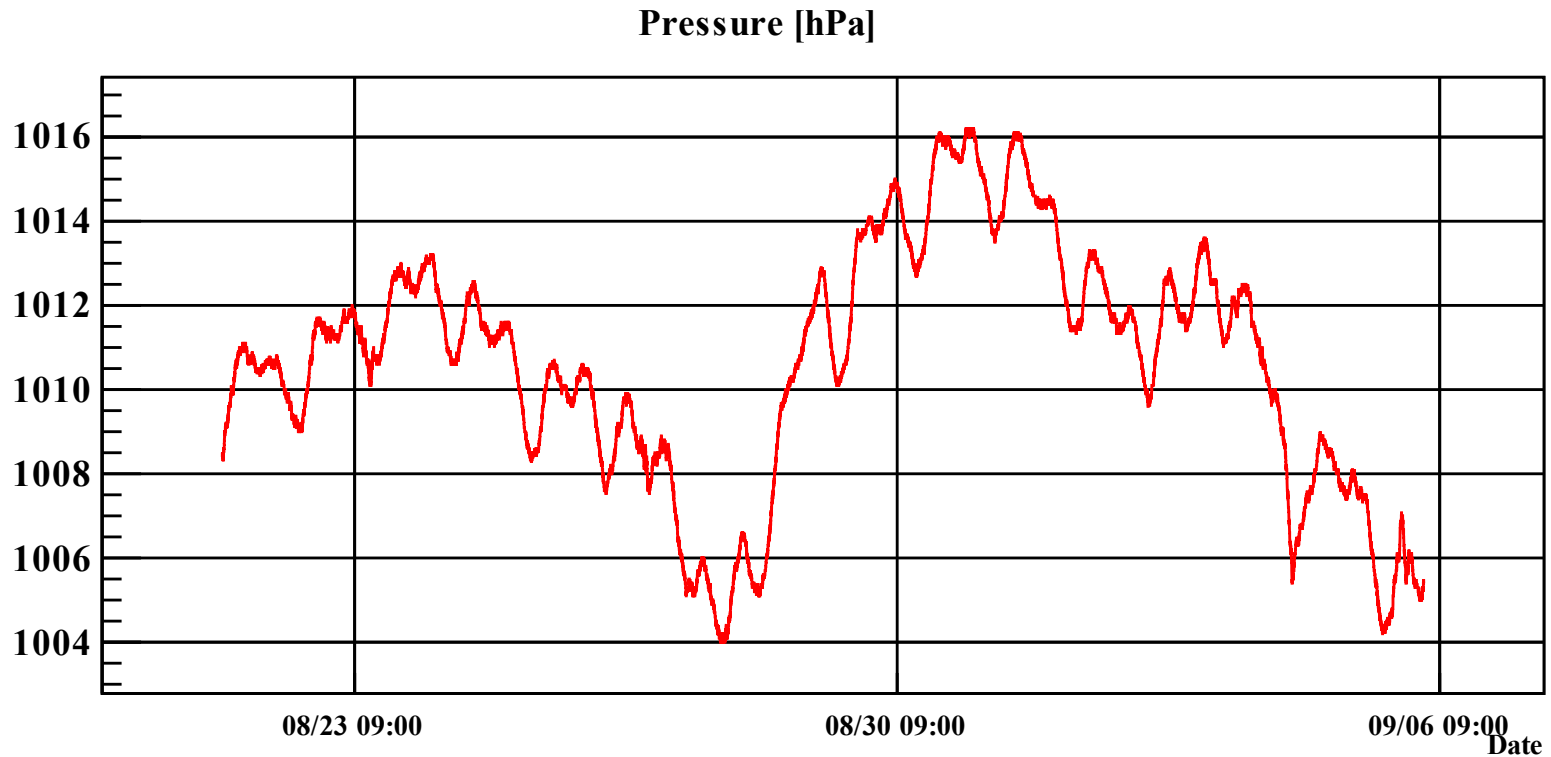

X-ray intensity scan at DLC-RPC WP

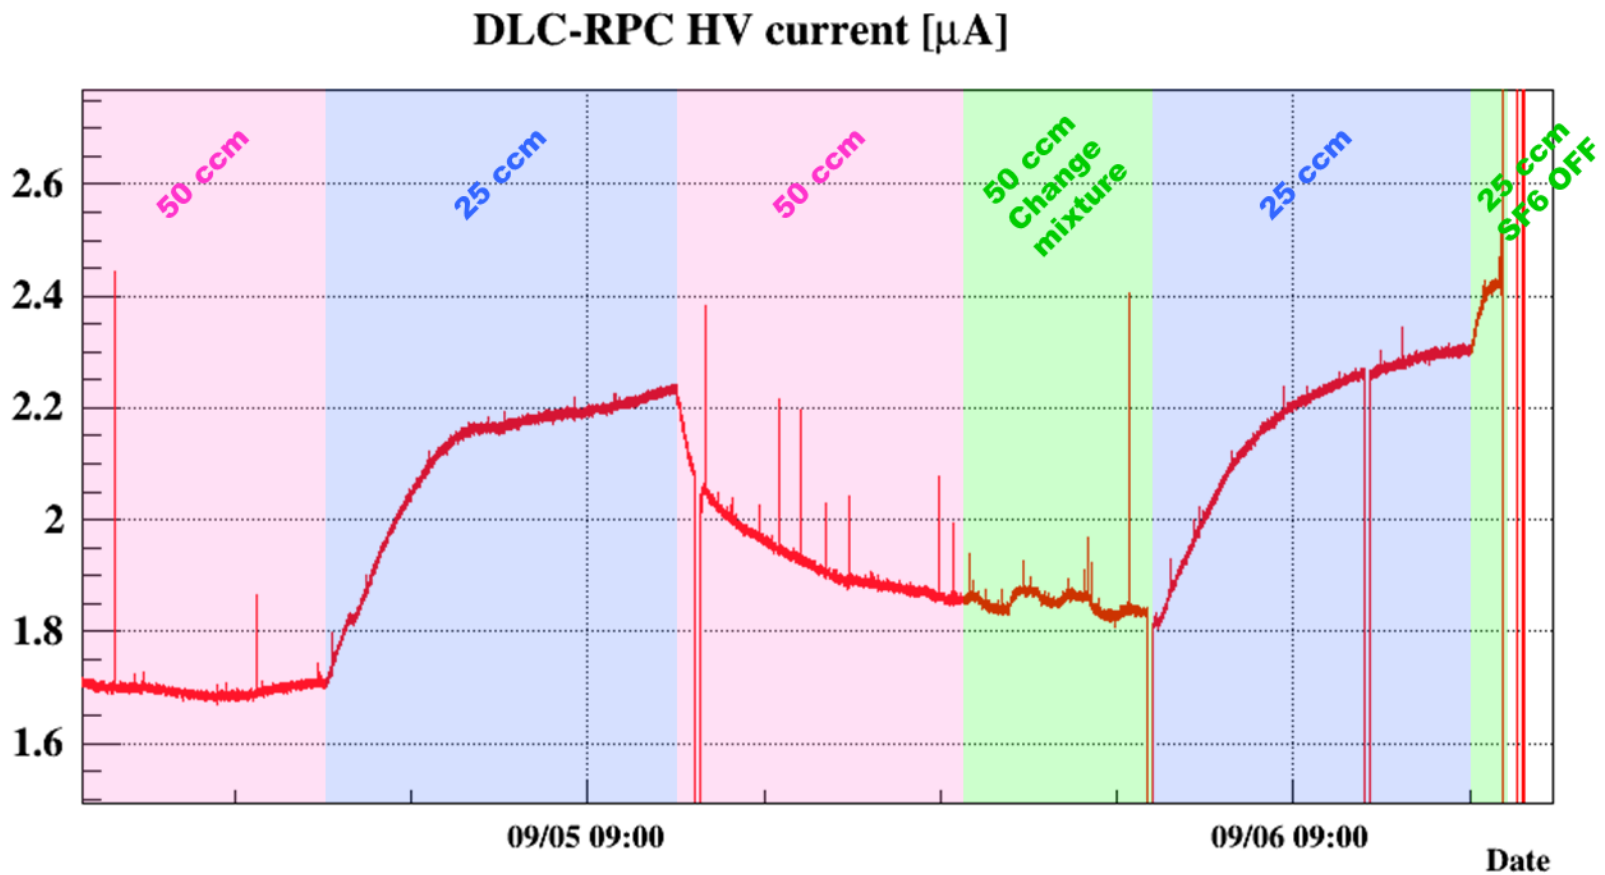

# Environment - pressure

➤ Long-term period: 8/24 – 9/5

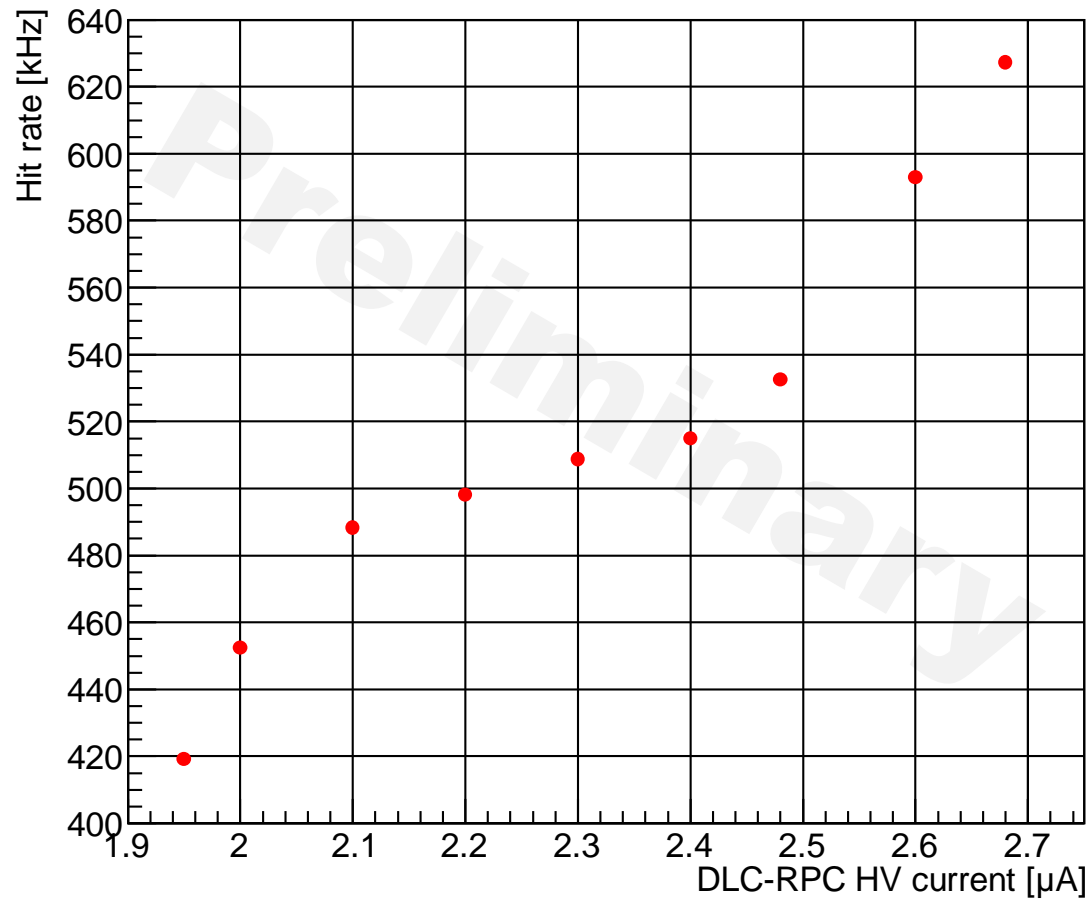

# Gas flow study

- DLC-RPC operated in high-flow rate and low-flow rate
  - High-flow rate ( $\sim 50$  ccm) / low-flow rate ( $\sim 25$  ccm)
  - Gas mixture did not change

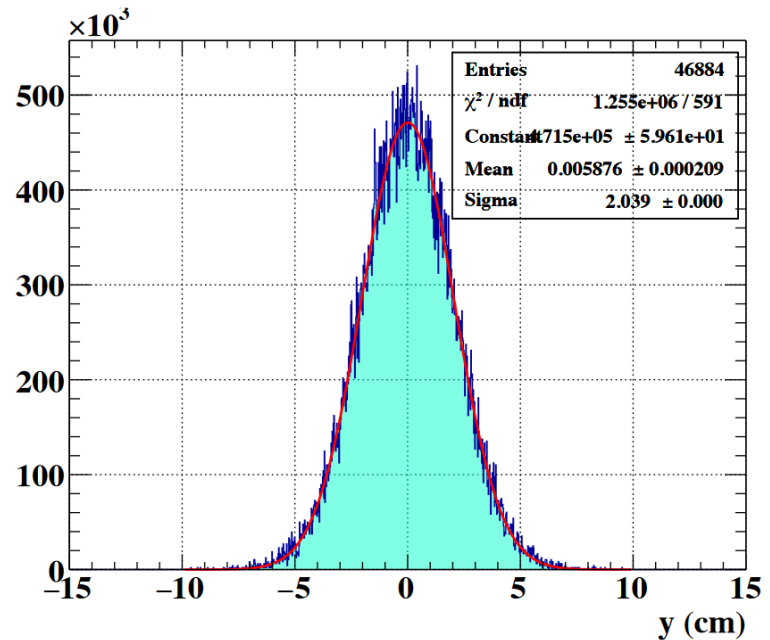

# Hit rate vs. DLC-RPC HV current

# $e^+$ distribution from RMD

**RMD  $e^+$  ( $E_\gamma > 48$  MeV)**  
 **$\sigma = 2.8$  cm**

**$\mu^+$  beam profile**  
 **$\sigma = 2.0$  cm**

# Aging test at KEK 2022

チェンバー内部のセットアップ

X線照射中

RPC HV current [ $\mu\text{A}$ ]

- $8.2 \text{ C/cm}^2$  相当の照射量
- 放電の問題で動作電圧は落としている
  - WP: 2.8 kV  $\rightarrow$  2.7 kV
- X線照射時間は非常に短い

# Space charge effect

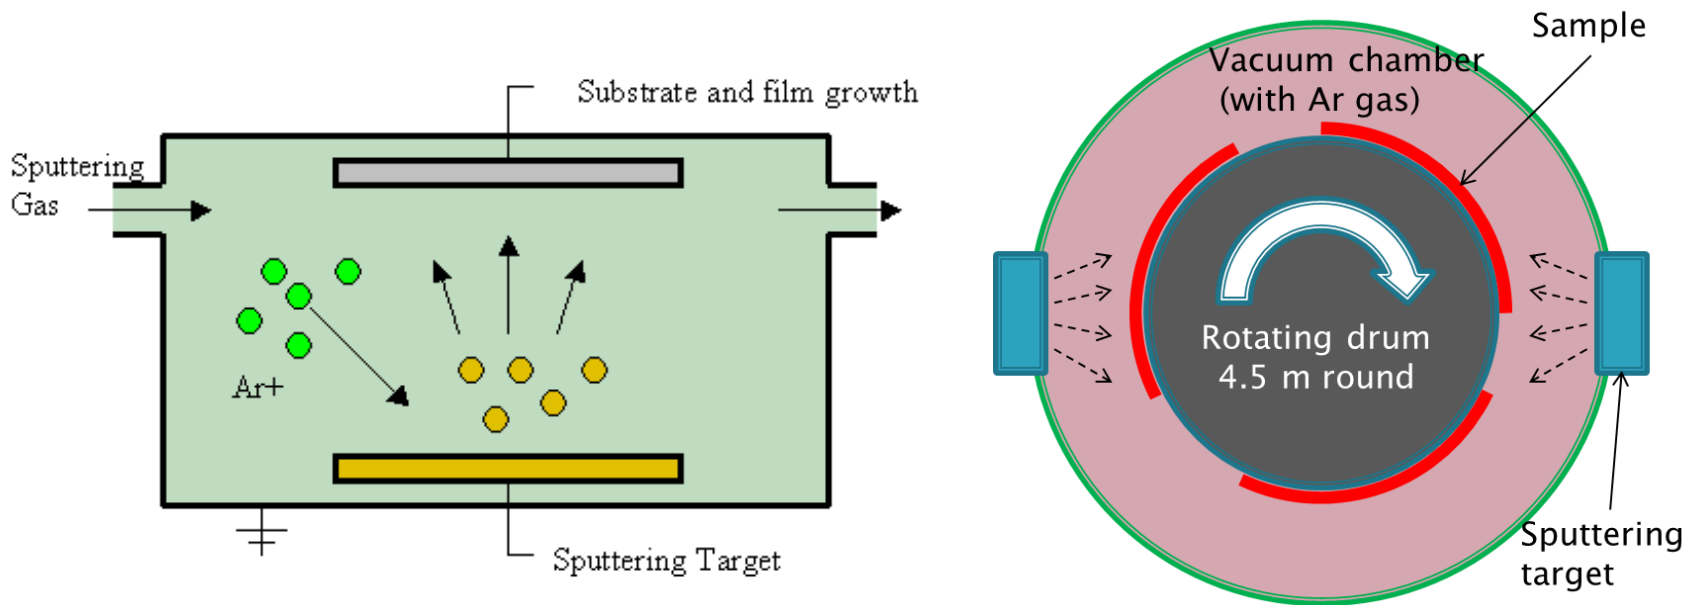

- Avalanche saturates at gas gain of  $10^{7-8}$

# DLC sputtering

## ➤ Sputtering method

1. Inert gas (mainly Ar) is added in a vacuum
2. Provides a negative charge to a deposition material  
→ Ionising gas atoms by glow discharge
3. Gas ions collide with target at high velocity
4. Tapped target constituent particles adhere to and are deposited on the substrate surface  
→ Forms thin films

# Photoresist

1. マスクをかけて  
UV光で露光する

2. 現像液によって  
非露光領域を溶かす

3. ピラーが完成する
